

# Computer graphics

## Outline

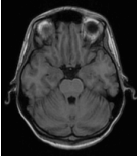

- ▶ The graphics pipeline
  - ▶ Model (description)
  - ▶ Transform (eye space)
  - ▶ Clip (viewing volume)
  - ▶ Rendering
    - ▶ Local lighting
    - ▶ Shading
    - ▶ Texture mapping
    - ▶ Global lighting
- ▶ Animation
  - ▶ Dynamic simulation
  - ▶ Kinematics simulation

3D to 2D projection

## Data acquisition

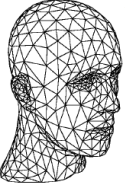

- ▶ Manual input
  - ▶ 3D max, AutoCAD
- ▶ 3D scanner/Range scanner
- ▶ Medical sensors
  - ▶ X-Ray
  - ▶ Ultrasound,
  - ▶ Magnetic Resonance Imaging (MRI)
  - ▶ Computed Tomography (CT)

<http://www.mpi-inf.mpg.de/~ag4-gm/>

## Modeling – triangle meshes

- ▶ Modeling: use **planar** patches (usually triangles) to compose the desired shapes
  - ▶ Easy to render
- ▶ The finer mesh the better approximation

▶ Triangulation: 計算幾何演算法

### Bazier curves and surfaces

- ▶ Bazier curve (Pierre Bazier 1970) : can define 3D curves by few control points

[http://en.wikipedia.org/wiki/B%C3%A9zier\\_curve](http://en.wikipedia.org/wiki/B%C3%A9zier_curve)

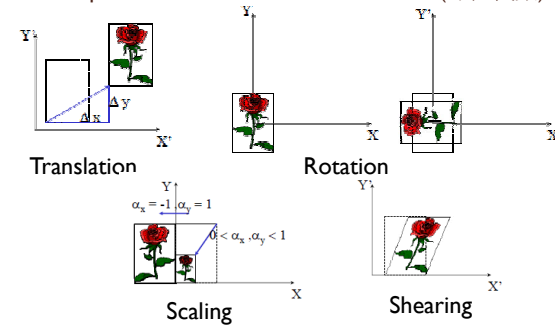

- ▶ Many usages, such as vectored font
- ▶ Bazier surface

▶ 數值方法

### Viewpoint transform

- ▶ To move objects to desired viewpoints
- ▶ Use special matrices to do the transforms (線性代數)

▶

### View volume

Only the portion of an object inside the view volume will appear inside the image window

▶

### Colored wireframe

▶ 3D→2D:線性代數， construction of wireframe 資料結構

### Colored visible wireframe

- ▶ Hidden surface removal
- ▶ Overlapped objects
  - ▶ Painter's algorithm
  - ▶ Z-buffer algorithm

▶ Hidden surface removal: 線性代數, Depth sorting: 演算法

### Ambient lighting

- ▶ 背景光，環境光
- ▶ Not associated with any source or direction

▶

### Diffuse lighting

- ▶ The scattered light by non-smoothed surface
- ▶ Lambert's cosine law: (普物)

▶

### Specular lighting

- ▶ Used to simulate metallic, shiny surfaces
- ▶ Consider the reflected light and the viewing angle

▶

### Flat shading (with diffuse lighting)

- ▶ One **normal** per triangle
- ▶ Constant color per triangle

### Gouraud shading (with diffuse lighting)

- ▶ After Henri Gouraud (1971)
- ▶ One **normal** per vertex
- ▶ Compute color per vertex
- ▶ Interpolate color per pixel

### Gouraud shading (with specular lighting)

- ▶ Problem: Mach Bands

### Phong shading (with specular lighting)

- ▶ After Bui-Tuong Phong 裴祥風 (1975)
- ▶ One normal per vertex
- ▶ Interpolate normal per pixel
- ▶ Compute color per pixel
- ▶ Good for curved and shiny surfaces

### Texture mapping

- ▶ Introduced by Catmull in 1974
- ▶ Map images to geometry
  - ▶ Simulate surface detail

### Bump mapping

- ▶ Introduced by Blinn (1978)
- ▶ Perturb the surface by a bump map

### Environment mapping

- ▶ Introduced by Blinn & Newell (1976)
  - ▶ Compute the reflection vector at each mesh vertex
  - ▶ Interpolate the reflection vector across the triangle
  - ▶ Use the reflection vectors to index the environment map

Image by Jim Blinn via debevec.org

Image by Aravind Kaliah & Amitabh Varshney

### Global lighting: Ray tracing

- ▶ Treat light as a pencil of rays, and trace their reflecting trajectory (普物)
- ▶ Most of the time is spent in intersection computations (資料結構，演算法)

### Global lighting: Radiosity

- ▶ Assumes area light sources
- ▶ Based on conservation of light energy (普物)
  - ▶ Light energy per unit time per unit area
- ▶ Need to solve a large linear system (線性代數, 數值方法)

### Dynamics simulation

- ▶ Applies laws of physics to determine position of objects

<http://www.eng.fea.ru/>

<http://www.aices.rwth-aachen.de/organization/institutes/combtch/>

### Kinematics simulation

- ▶ Applies characteristics of joints and appendages to determine position of objects
- ▶ Hierarchical transformations

▶ From Amitabh Varshney's lecture notes.
