## CS4311 <br> Design and Analysis of Algorithms

Lecture 12: Dynamic Programming IV

## Subsequence of a String

- Let $S=s_{1} s_{2} \ldots s_{m}$ be a string of length $m$
- Any string of the form

$$
s_{i_{1}} s_{i_{2}} \ldots s_{i_{k}}
$$

with $i_{1}<i_{2}<\ldots<i_{k}$ is a subsequence of $S$

- E.g., if $S=$ farmers
$\rightarrow$ fame, arm, mrs, farmers, are some of the subsequences of $S$

## Longest Common Subsequence

- Let $S$ and $T$ be two strings
- If a string is both
- a subsequence of $S$ and
- a subsequence of $T$,
it is a common subsequence of $S$ and $T$
- In addition, if it is the longest possible one, it is a longest common subsequence

## Longest Common Subsequence

- E.g.,

$$
\begin{aligned}
& S=\text { algorithms } \\
& T=\text { logarithms }
\end{aligned}
$$

- Then, aim, lots, ohms, grit, are some of the common subsequences of $S$ and $T$
- Longest common subsequences: lorithms, Igrithms

## Longest Common Subsequence

- Let $S=s_{1} s_{2} \ldots s_{m}$ be a string of length $m$
- Let $T=t_{1} t_{2} \ldots t_{n}$ be a string of length $n$

Can we quickly find a longest common subsequence (LCS) of $S$ and $T$ ?

## Optimal Substructure

Let $X=x_{1} x_{2} \ldots x_{k}$ be an LCS of

$$
S_{1, i}=s_{1} s_{2} \ldots s_{i} \text { and } T_{1, j}=\dagger_{1} \dagger_{2} \ldots \dagger_{j}
$$

Lemma:

- If $s_{i}=\dagger_{j}$, then $x_{k}=s_{i}=\dagger_{j}$, and $x_{1} x_{2} \ldots x_{k-1}$ must be the LCS of $S_{1, i-1}$ and $T_{1, j-1}$
- If $s_{i} \neq \dagger_{j}$, then X must either be
(i) an LCS of $S_{1, i}$ and $T_{1, j-1}$, or
(ii) an LCS of $S_{1, i-1}$ and $T_{1, j}$

## Optimal Substructure

Let len ${ }_{i, j}=$ length of the LCS of $S_{1, i}$ and $T_{1, j}$
Lemma: For any $i, j \geq 1$,

- if $s_{i}=t_{j}$, len $n_{i, j}=\operatorname{len}_{i-1, j-1}+1$
- if $s_{i} \neq \dagger_{j}$, len $_{i, j}=\max \left\{\operatorname{len}_{i, j-1}, \operatorname{len}_{i-1, j}\right\}$

## Length of LCS

Define a function Compute_L(i,j) as follows:
Compute_L(i,j) /* Finding len $\mathrm{l}_{\mathrm{i}} \mathrm{j}$ */

1. if $(i==0$ or $j==0)$ return 0 ; /* base case */
2. if $\left(s_{i}==\dagger_{j}\right)$
return Compute_L(i-1,j-1) + 1;
3. else
return max \{Compute_L(i-1,j), Compute_L(i,j-1)\};
Compute_L( $m, n$ ) runs in $O\left(2^{m+n}\right)$ time

## Overlapping Subproblems

To speed up, we can see that:
To Compute_L(i,j) and Compute_L(i-1,j+1), has a common subproblem:

Compute_L(i-1,j)
In fact, in our recursive algorithm, there are many redundant computations!
Question: Can we avoid it?

## Bottom-Up Approach

- Let us create a 2D table $L$ to store all len $_{i, j}$ values once they are computed
BottomUp_L( ) /* Finding min \#operations */ 1. For all $i$ and $j$, set $L[i, 0]=L[0, j]=0$; 2. for ( $i=1,2, \ldots, m$ )

Compute $L[i, j]$ for all $j$ :
// Based on L[i-1,j-1], L[i-1,j], L[i,j-1]
4. return $L[m, n]$;

Running Time $=\Theta(m n)$

## Remarks

- Again, a slight change in the algorithm allows us to obtain a particular LCS
- Also, we can make minor changes to the recursive algorithm and obtain a memoized version (whose running time is $O(m n)$ )

Example Run: After Step 1

|  |  | $D$ | $O$ | $R$ | $M$ | $I$ | $T$ | $O$ | $R$ | $Y$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $D$ | 0 |  |  |  |  |  |  |  |  |  |
| $I$ | 0 |  |  |  |  |  |  |  |  |  |
| $R$ | 0 |  |  |  |  |  |  |  |  |  |
| $T$ | 0 |  |  |  |  |  |  |  |  |  |
| $Y$ | 0 |  |  |  |  |  |  |  |  |  |
| $R$ | 0 |  |  |  |  |  |  |  |  |  |
| 0 | 0 |  |  |  |  |  |  |  |  |  |
| $O$ | 0 |  |  |  |  |  |  |  |  |  |
| $M$ | 0 |  |  |  |  |  |  |  |  |  |

Example Run: After Step 2, $i=1$

|  |  | $D$ | $O$ | $R$ | $M$ | $I$ | $T$ | 0 | $R$ | $Y$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
